The goat was in four pastures on the mountain. (AP Photo/Becky Bohrer) Yoho National Park officials say that the bear killing the goat is a rarity in nature. A mountain goat is held responsible for the death of a grizzly bear found slumped near a path in the Yoho National Park of British Columbia earlier this month. David Laskin, an ecologist of wildlife with Parks Canada, says that a necropsy on the carcass found consistent wounds with the size and shape of the horns of mountain goat, with one under each of the armpits of the female bear and one on the side of the neck. It says that other causes of death have been excluded, including human involvement. Laskin says it is common for the grizzlies prey on the mountain goats, with the tendency to attack from above, and it is not unusual that a bear can be wounded in the crack. But he says that a goat fatally hurts a bear is "very rare". Laskin says that the adult bear was smaller in size between the population of 25 to 30 grizzlies in the Yoho and Kootenay national parks, but was not unusually small. "It was very interesting and it's not something we normally meet," Laskin said in an interview. "It's still a lot of a female grizzly bear in its first reproductive, however our grizzly bear population are still healthy and stable in the park." The bear was a adult, but the necropsy showed no signs he had ever had. Laskin says it's hard to assess the bear hunting experience, but its smaller size may have played a role in the fatal attack. The bear weighed about 68 kg. The average weight for a male mountain goat is about double.
