Android version 4.4 2 kitkat download

Google had released the Android 4.4.1 update last week and halted it because of a few issues with that update and has now released the 4.4.2 update to everyone today. The Update is right now being made available to the Nexus 4, Nexus 5, Nexus 7 and the Nexus 10 owners. If you own any of these devices its recommended to check out the Settings > Updates section right away if not download the firmware from the links below and side load the update onto your device. Here are the download links to the respective firmware updates for the Nexus Devices which you can sideload and install onto your devices. Update : Nov 13, 2013 The official Android twitter account posted an update today, saying that the Nexus 7 and Nexus 10 tablet devices from Google are going to get the Android 4.4 KitKat update as an over-the-air update. The devices include the Nexus 10, and the 2012, 2013 versions of the Nexus 7 tablet device. The KitKat OS version comes with a lot of features, enhancements and changes which take the Android usage experience to the next level. These two were the devices which were to receive the Android 4.4 KitKat update earlier than the other devices. Starting today, Nexus 7 (2012 and 2013) and Nexus 10 will be getting a tasty update to Android 4.4. KitKat The update is first going to roll out to the Nexus 7 devices which have only the Wi-Fi functionality, and the data one needs to wait to get the update. The roll out of the Android KitKat for the Nexus 10 would start from today itself. Some of the main changes to the features and additions included in this update: Ok Google Feature on Home screen - Voice recognition New dialer app with favorites and built-in search Caller ID with Google Maps searching for listings with Phone number Better cloud storage Wireless printing Full screen immersive mode - within Applications Speeder performance Screen recording OS level support for IR Blasters, low power sensors, additional Bluetooth profiles New lock screen, album art on screen lock for music player Added up security NFC for authorizing payments, Tap & Pay The Nexus 5 from Google already comes with the Android 4.4 KitKat OS, and there are some special features and additional support to the hardware of the device, like the proper support for the Pedometer so that there are step counters already available in the device through the various apps in the Play Store. Do check out the device for the update and keep it connected to Wi-Fi so that the update pops up any time soon, or else you might need to go to Settings > About > Software Update and manually search for the update of Android KitKat on your device. It is quite a big update, so you might have to take a backup of your device so that the update goes through well without any issues. Welcome Android Devs this page provides you all Android SDK Packages for Android 4.4.2 KitKat API 19. We split them to several parts:Base Package: Android SDK CMDLine-ToolsAndroid SDK Tools is the base package and is required to be setup first before anything else. It contains `sdkmanager` CLI tools that manages other packages. You must install it as this is required packages.Essential PackagesThey are packages that essentially needed for your daily Android app development. It consists of Compiler, Source, Platform Tools, Build Tools and optionally System Images. Some packages must be installed as they are required packages, others are recommended as it brings extra benefit and enhancement. Since not everything there don't affect the compatibility. Extras PackagesThey are packages that brings support to extra features and hardware that are not available by default on the main compiler. It consists of Android Support Repository, Google Support Library, Play Services, etc. Apps SDks and several others. We recommend you to install some extras as they bring support to the older versions of Android and extra features on your Emulator. Intel HAXM and AMD Emulator Hypervisor Packager. Emulator Hypervisor Manager. Android OS System Images. By adopting the System Image, Intel HAXM accelerates the emulation by taking advantage of hardware acceleration capability of compatible CPUs. If you wish to test your app on your computer, we recommend you to install Emulator and Intel HAXM (for Intel CPU) or AMD Emulator Hypervisor (for AMD CPU) and several System Images as your choice. You don't need to install them if you prefer to test your app directly of a real device instead.NDK ToolkitNDK and C++ packages contains SDK and toolkit for Android Development that is written in C/C++. The package is necessary if your codebase is completely written in C/C++ OR if you need some parts of the code to be written in C++. So if your code is mainly written in Java/Kotlin, this packages are optional to install. In real world development, NDK is very often used by the 3rd parties toolkit like C/C++-based game framework that target Android OS. Documentation for Offline BrowsingIn the past, documentation is officially been provided so developer can browse everything Android offline. Today, docs are no longer provided officially but community has fetched it so nicely so we can browse the extensive Android docs without internet connectionAll the packages were last checked on: 2021-8-05 | 6:56:0 PMAll the packages were taken directly from the official Google's Android host. Before downloading and installing these packages make sure you have installed the Android SDK Tools/Manager first. SDK Tools is REQUIRED before installing any other packages. Check out for more info:SDK CMDLine-Tools/ManagerOLD SDK Tools/ManagerHow to Install Android SDK OfflineIf you have installed SDK Tools then you are ready to install other packages. Before installing these packages below, we assume that you've already install SDK CMDLine-Tools/ManagerA Notice for Publishing your Android App on Google PlayStarting from August 2018, Google made new requirements for the new apps published on their Play Store. Your apps MUST be configured with targetSdkVersion>26 aka Android Oreo 8.0 API 26 or higher. Thus as developer you should aware since this will impact you as app publisher. Because if targetSdkVersion set to 26 or higher , you will need Compiler version 26 or higher with this requirements. Android Studio v3.2+ will flag targetSdkVersion
