There have been many posts from Homeworx HW-150PVR users about updating their firmware, with some sharing their experiences and others seeking advice on how to obtain the latest software version.Exciterfan was one of the first to report that they had a new device and wanted to ensure they were running the latest firmware. After checking the Information Menu, they found that their Software Version was August 29/14 16:22:49 and their Hardware Version was MLG7802-ATSC-V3.Len kneuse replied, saying that Exciterfan had the same hardware and software versions as he did, and there was a new firmware available. He suggested sending an email to rma\_east AT mediasonic.ca with the hardware and software information requesting a firmware update.Exciterfan thanked Len for his help and reported that they had already emailed the support team asking about the firmware update. They appreciated Len's guidance and waited patiently for a response.Another user, kneuse, shared their experience of getting an email with their firmware update after asking on Friday afternoon. He advised others to be patient as it may take some time to receive the update.Exciterfan then expressed frustration with the moderator's posts referring to firmware versions like V8, V10, V12 etc., and noted that their device did not display the current firmware version. They suggested that Mediasonic should change their posts to include the same information provided by the device or offer a website for users to enter their hardware version and receive the latest firmware version.Kneuse offered an explanation for why Mediasonic may not be releasing updates, stating that there have been multiple hardware changes requiring specific firmware matches. They also acknowledged that customers risk bricking their devices if they update the firmware without consulting the support team first.Exciterfan reported a recent issue with 1080P playback on their component video out, resulting in a blank screen. However, using an HDMI cable from their spare HDMI port resolved the problem.After receiving their firmware update email, Exciterfan expressed surprise at not knowing the exact firmware version they now have. They thanked Len for sharing his experience and reported that he had V6.0 after his update.Other users also shared their issues with audio sync problems during recording, with some finding temporary solutions by resetting the device or using a specific workaround. RWoodcock mentioned that they still experienced audio issues despite receiving an email with their firmware update.Finally, Admin\_Mediasonic provided guidance on how to request firmware updates and emphasized the importance of consulting the support team before updating the firmware.Computer and extract it. 2. Copy the usb upgrade\_all\_flash.bin file to a USB drive. < Do not place in folders> 3. Insert the USB drive into the unit's USB port. 4. Press the menu button on the remote and go to the System Tab. 5. Choose Software update and then USB upgrade. 6. Select the file usb\_upgrade\_all\_flash.bin and press OK. 7. The unit will start updating and will reset after completion. 8. If the blue "software upgrading" screen isn't visible, format the flash drive to FAT32 and try again. 9. Once the unit restarts, use the menu button to set your region and enable DST for daylight saving time. 10. Rescan channels by switching the source to Air or Cable. (Note: Cable is for Clear QAM only, available in some US cable providers. Not available in Canada.) 11. Ensure your recording device is formatted to NTFS. Use left/right arrows to navigate the slideshow or swipe left/right on mobile devices. When I check System>Information, it shows "SW Version: CL503883 131012 v1, HW Version:7816-1237-ATSC-V2." If these aren't current, where can I download the latest updates? I assume I can download them, transfer to a USB drive, and install via Software Update. Thanks. kper2014 Posts: 2 Joined: July 25th, 2014, 10:38 pm Post by kper2014 July 25th, 2014, 11:42 pm The firmware update page on this forum isn't very clear, but it seems the versions listed might be specific to your HW-150PVR hardware. This post would be easier to understand if it listed the hardware version each firmware version applies to. Like your "SW Version: CL503883 131012 v1, HW Version:7816-1237-ATSC-V2." (which matches mine, by the way) That way, users like us can match our hardware version to the correct firmware version, reducing questions. Yes. I also just looked for the latest firmware update for the HW-150PVR I purchased... One of the first things you do with new hardware these days... days... ###
