Vlookup across multiple sheets and sum results

When you work with spreadsheets in Microsoft Excel, you might find you need to add business data from cells to multiple spreadsheets. You can make the Sum Excel formula reference another sheet, or multiple sheets, and add a range of cells in those sheets. You can use the Sum function to add data to two or more cells, or all data within a range of cells. To do so, you can manually type the Sum function or use the Auto*Sum* button located in the Edit section in the Excel menu bar. To use the Sum function to add a column of cells to the worksheet you are working on, click the first opened cell at the bottom of the column you want to add and click the AutoSum button to insert the Sum function. This automatically refers to the sum of cells in the column you chose after hitting Enter. If you want to type the Sum function, either to specify which single cells add regardless of columns, write the Sum function as follows: =SUM (cell1, cell2). As an example, this would look like = SUM (A14, B17) when formatted with two cells. You can add a range of cells with the Sum formula using a colon instead of a comma, so: =SUM (A1:A14). To find an Excel Sum from another sheet, you must first choose a cell where the total Sum formula will go. This can go on any of the sheets in Excel document. Then, you need to format the sum formula to refer to the other sheet with theor range of cells you want to add. to add cells located in a different worksheet to your formula, first start the sum formula by typing = sum (and then click the cell located in that other worksheet. type a comma, then select any other cell. to refer to a separate sheet outside the sheet where you are, you can do so in a few ways. First, you can select the cells you want to add from another worksheet by clicking them while holding the ctrl key. Secondly, you can type the sheet name you want to refer manually as part of the sum formula. you can find the name of any sheet in the document by checking the bottom tabs of the excel workbook. Once you have the sheet name you want to refer to, here is how you change the excel sum formula so that multiple sheets can be recalled at once. add the sheet name, followed by an exclamation point, and then the cell name you want to add: =sum (Sheet1!A14,Sheet2!B17;) this will make the formula excel reference another sheet, but you can also simplify the formula to =sum (A14,Sheet2!B17) which will add a cell from another sheet to a cell on the current sheet. we say you have a workbook with your company's income data from each month on a separate sheet. if you want to add revenue from the January and February sheets together, you can click and select the cells from January and February, or type the formula manually to resemble this: =sum (Jan!C12, Feb!C12). after hitting in,the cell should have the sum of total income from the January and February sheets in it. Keep with the example above, let's say once the year is finished, you want to add each cell containing each month total revenue from the whole range of sheets. You can click the + sign to create a new sheet and click the name to rename "Sheet1" as "Revenue" and then choose a cell to insert the formula. To add an Excel Sum formula on multiple sheets, determine the range of sheets in question by separating them with a colon in your Sum Formula, thus written: =SUM (Sheet1:Sheet12!Cell#). This refers to all sheets in a range, and to the corresponding cell in each sheet. In this case, you want total revenues to be added to be in the same cell corresponding in each sheet. For our example, where we want to find the sum of the total turnover of all twelve months, the formula would seem = SUM (Jan:Dec!C12). Alternatively, you can refer to a range of cells to add on all sheets, such as: =SUM (Sheet1:Sheet12!A12:C12). This adds all cells from A12 to C12 through Sheet1 through Sheet12. For our example, if you want to find the sum of a range of cells through the sheet of each month, instead of adding a cell of each sheet, that formula would be similar to this: =SUM (Jan:Dec!A12:C12). This tutorial will show how to use SUMPRODUCT and SUMIFS functions to sum the data that meet certain criteria in multiple sheets in Excel andSheets. Regular summa through multiple sheets Sometimes your data could cover different worksheets in an Excel file. This is common for data collected periodically. Each sheet in a workbook may contain data for a set period of time. We want a formula that summarizes the data contained in two or more sheets. The SUM function allows you to easily sum the data on multiple sheets using a 3D reference: However, this is not possible with the SUMIFS function. Instead, we have to use a more complicated formula. Sum if through multiple sheets This example will summarise the number of scheduled deliveries for each customer on multiple worksheets, each holding the data for a different month, using the SUMIFS, SUMPRODUCT and INDIRECT functions: =SUMPRODUCT(SUMIFS(INDIRECT("'" &F3:F6&"'"; "D3:D7"),INDIRECT("'" &F3:F3 Step 1: Create a SUMIFS formula for 1 input sheet Only: We use the SUMIFS function to sum the number of deliveries planned by the customer for a single sheet of input data: Step 2: Add a reference sheet to the Formula We hold the same result of the formula, but we specify that the input data is in the sheet called 'Step 2' =SUMIFS('Step 2'!D3:D7,'Step 2'!C3:C7,H3) Step 3: Nest Inside a SUMPRODUCT Function To prepare the formula to perform SUMIFS calculations on multiple sheets and then to sum the results together, we add a SUMPRODUCT function around the formula = SUMPRODUCT('Step 3'!D3:D7,'Step 3'!C3:C7,H3) using SUMIFSon a sheet produces a single value. Through multiple sheets, the SUMIFS function emits a number of values (one for each worksheet). We use the SUMPRODUCT function to complete the values in this array. Step 4: Replace the sheet reference with a sheet name list We want to replace the sheet name part of the formula with a data list containing the values: Jan, Feb, Mar and Apr. This list is stored in F3 cells: F6. The INDIRECT function ensures that the text list showing the names of the sheets is treated as part of a valid cellular reference in the SUMI'S function. In this formula, the reference of the previously written range: It is replaced by: INDIRECT("'"&F3:F6&"'"&"D3:D7") Quote marks make the formula difficult to read, so here it is shown with additional spaces: INDIRECT (" & F3: F6 & "!' " & "D3:D7") Using this way of reference to a list of cells also allows us to sum up data from multiple sheets that do not follow a style of numerical list. A standard 3D reference would require sheet names to be in style: Input1, Input2, Input3, etc., but the example above allows you to use a list of any sheet name and refer them to a separate cell. Clamping cell references To make our formulas easier to read, we showed formulas without reference to locked cells: =SUMPRODUCT(SUMIFS(INDIRECT(" &F3:F6&"'"&"D3:D7"),INDIRECT(" &F3:F6&"'"&"C3:C7"), H3)) But these formulas will not becorrectly when copying and pasting elsewhere in the file. Instead, you should use blocked cell references like this: = SUMPRODUCT(SUMIFS(INDIRECT("'" &\$F\$3:\$F\$6&"'"&"D3:D7"),INDIRECT(" &\$F\$3:\$F\$6&"'"&"C3:C7"), H3) Read our article on Locking Cell References to learn more. Summon if through multiple sheets in Google sheets Using the INDIRECT function to refer to a list of sheets in a SUMPRODUCT and SUMIFS function is currently not possible in Google Sheets. Instead, separate SUMIFS calculations can be made for each input sheet and the results added together: = SUMIFS(Jan!D3:D7, Jan!C3:C7,H3)+SUMIFS(Feb!D3:D7,Febl!C3:C7,H3)+SUMIFS(Mar!D3:D7,Marl!C3:C7,H3) vlookup across multiple sheets and sum results in excel. how do you vlookup across multiple sheets and sum results in excel. how to sum vlookup from multiple sheets. can you use vlookup over multiple sheets. can you use vlookup across multiple worksheets
