

I'm not a robot

Can you show some evidence that the price in your material master is really just 3.66 / 1Also explain what this 905 movement does, since it is customized in your company and not SAP standard, further tell if your stock quantity was zero after your movement. Hi Dinesh,This is the case where component exact consumption is not known, In such cases the consumption of component only booked after the actual consumption. Like in this case user will weight remianing Grease and book the actual consumption in system. Backflush scenario is not recommended in this case.You will get nice report in COOIS for expected and actual consumption for such material.Regards,Shekhar The Revaluation of Consumption step reevaluates the COC account but should revalue the original G/L account or CO account assignments according to Movement Type Group updated in the Material Ledger document. They are used to represent the physical movement of goods whether they are being received, issued, transferred, or returned. Movement types help manage stock levels, track inventory changes, and update financial accounts based on the type of transaction. Movement types are a two- or three-digit code that represents a specific type of stock movement. Each movement type is associated with specific business processes and has different effects on stock quantity and valuation in inventory. In this article, we'll explore the significance of movement types, how they are used in various scenarios, and provide a detailed table of all SAP movement types. A Movement Type in SAP defines the nature of a goods movement, such as goods receipt, goods issue, stock transfer, or physical stock adjustments. Every time goods are moved from one location to another or even when they are received or issued, a movement type is assigned to the transaction. The movement type affects several factors: Stock Quantity: Whether the stock level increases, decreases, or stays the same. Stock Valuation: If and how the value of stock is affected in financial terms. Material Document: Movement types are recorded in material documents for traceability. Accounting Document: Movement types also create financial documents when stock affects the company's balance sheet. Goods Receipt (GR): When materials are received from a vendor or production. Goods Issue (GI): When materials are withdrawn from stock for consumption or delivery. Stock Transfer: Moving goods between storage locations, plants, or warehouses. Return of Goods: When materials are returned to the vendor or customer. Physical Inventory Adjustment: Stock correction following physical inventory checks. Whenever a material document is created for a goods movement, SAP requires the movement type to be entered. This ensures that SAP knows how to process the transaction, what stock to update, and whether any financial postings are necessary. Movement types can also control which stock types are affected (e.g., unrestricted-use stock, blocked stock). Which valuation types are impacted (e.g., raw materials, finished goods). Which document types are triggered (e.g., material document, accounting documents). Here's a comprehensive table listing the most commonly used SAP movement types along with their description: Movement Type Description 101 Goods Receipt for Purchase Order 102 Goods Receipt Reversal for PO into GR Blocked Stock 105 Return from GR Blocked Stock 122 Return Delivery to Vendor 161 Return Delivery for Vendor (for Purchase Order) 201 Goods Issue for Cost Center 231 Goods Issue for Project 261 Goods Issue for Cost Center 301 Stock Transfer (Plant to Plant) 311 Stock Transfer (Storage Location to Storage Location) 315 Stock Transfer (GR Blocked Stock to Unrestricted Use) 321 Transfer from Quality Inspection 333 Physical Inventory (Plus Posting) 340 Transfer from Blocked to Unrestricted Stock 411 Transfer from Unrestricted Use 451 Return from Customer 453 Goods Receipt for Purchase Order 531 Goods Receipt for Production 601 Goods Issue for Delivery 641 Stock Transfer for Delivery 701 Inventory Difference 7011 Inventory Difference Unrestricted Stock 703 Inventory Difference Quality Inspection Stock 703 Inventory Difference Blocked Stock 101 Goods Receipt for Purchase Order This is the most common movement type used when materials are received from a vendor based on a purchase order. It increases the stock level in inventory and updates the financial accounts for the goods received. 201 Goods Issue for Cost Center Used when materials are issued to a cost center for internal consumption, this movement type reduces the stock level and posts the financial cost against the specified cost center. 301 Stock Transfer (Plant to Plant) This movement type is used when goods are transferred between plants. It creates an outbound stock movement from the issuing plant and an inbound stock movement at the receiving plant. 601 Goods Issue for Delivery Used during the delivery of goods to a customer, this movement type reduces the available stock and updates the financial accounts to record the sales transaction. 701/702/703 Inventory Differences These movement types are used to record stock discrepancies found during a physical inventory count, adjusting stock levels in the system to match actual stock. Movement types in SAP play a pivotal role in managing goods movements and ensuring that inventory levels and financial records stay accurate. Understanding and correctly using these movement types helps businesses maintain control over their material stocks and ensure proper accounting. Whether you're processing goods receipts, issuing stock for production, or adjusting inventory levels after a count, knowing the correct movement type for each situation is essential for accurate SAP transactions. Goods Movement Types, Special Stocks and Stock types When a goods movement is entered into the system, a movement type should be entered as well to differentiate between the various goods movements. A movement type is a three-digit identification key for a goods movement. The following table contains examples of movement types with a short description of the standard movement types. Read more... Download PDF : li:activity:7081646867637264388?utm\_source=share&utm\_medium... Dear, You can use transaction OMJJ to check the difference between 261 & 907 movement type. Movement type 907 is a custom movement type created in your company. With respect to configuration as explained by Mr.Ramana you need to check the movement type assigned to package CO in transaction OPKA.Regards,Prasobh
