## Calculate time difference google sheets

Text 6: Google Sheets

File Edit View Insert Format Data Tools Add-ons Help All changes saved in Drive

The publication of today's blog is about discovering the difference between two dates leaves Google. Will see many formulas of DATEDIF to count the days, months and year ± os, and know how the days of access used to count working days, even if your holiday is based on a custom schedule. Many of the spreadsheets dates Users are confused, if not extremely difficult to handle. But I believe it or not, there are some practices and direct functions for that purpose. DATEDIF network and days are a couple of them. As with functions, their names suggest the action. The same goes for DATEDIF. DIF should be read as dated, undated if and represents the difference in date. Therefore, DATEDIF in Google Sheets calculates the difference between two dates. Let's break it into pieces. The function requires three arguments: =DATEDIF (START\_DATE, END\_DATE, UNIT) START\_DATE: a date used as a starting point. Must be one of the following: a date in two quotations: "8/13/2020" a reference to a cell with a date: A2 A formula that returns a date: Date (2020, 8, 13) A number representing a particular date and which can be interpreted as a date leaves Google, for example, 44056 represents 13 August 2020. END\_DATE: a date used as the endpoint. It must be of the same format as the start\_date. Unit: Used to tell the difference function what to return. Here is a complete list of units you can use: "D" (short for days) returns the number of days between two dates. "M" - (months) the number of full months between two dates. "(year ± os) the number of full year ± os. "MD" (ignoring the months days) the number of days after the restaciñn of whole months. "YD": (days ignoring the year ± os) the number of days after the restaciñn of ± os whole year. "YM" - (ignoring months ± os year) the number of full months after subtracting ± os ± year Note. All units should be put to formulas in the same way as they appear above, in double quotations. Now let's piece all these parts together and see how Datedif Datedif work in Google Sheets. Example 1. Counting every day to follow some orders. All of them have been shipped in the first half of August - shipping date - that will be my start date. There is also an approximate date of delivery - scheduled date. I will calculate days - D - between shipping and due dates to see how long it takes to get the items. Here is the formula I should use: =DATEDIF(B2, C2, D) Enter the DATEDIF formula to D2 and then copy it into the column to apply to other rows. Tip. You can always calculate the entire column immediately with a single formula using ARRAYFORMULA: =ArrayFormula(DATEDIF(B2:B13, C2:C13, D)) Example 2. Count of days ignoring months Imagine that there are a few months between two dates. How do you count only days as if they belonged to the same month? That's right: ignoring the full months that have passed. DATEDIF calculates this automatically when using the MD: =DATEDIF(A2, B2, MD) The function takes months and counts the remaining days. Example 3. Count of days ignoring years Another unit - YD - will help when the dates are more than a year between them: =DATEDIF(A2, B2, YD) The formula will subtract years first, and then calculate remaining days as if they belonged to the same year. I count working days in Google Sheets There is a special case when you need to count only working days in Google Sheets. The DATEDIF formulas will not be very helpful here. And I think you'll agree that the remaining weekends manually is not the most elegant option. Luckily, Google Sheets has a pair of spells not so magical for that.: Example 1. NETWORKDAYS Function The first is called NETWORKDAYS. This function calculates the number of working days between two dates, excluding weekends (Saturday and Sunday) and even holidays if necessary: =NETWORKDAYS(start\_date, end\_date, [holidays]) start\_date - date used as a starting point. Note. If this date is not a party, it is counted as day. End Date: a date used as a final point. Requested. Note. If this date is not a holiday, it is counted as a working day. Holidays: This is optional when you need to point out specific vacations. It must be a range of dates or numbers representing dates. To illustrate how it works, I will add a list of holidays that take place between shipping and expiration dates: so, column B is my start date, columns c & e "Date of completion. The dates on column E are the vacation to be considered. Here is the way the formula should look: =networks (B2, C2, \$ E \$ 2: \$ E \$ 4) Have you noticed how the number of days decreased compared to DATEDIF formulas? Because now the function is automatically subtracted every Saturday, Sunday and two holidays taking place on Friday and Monday. Note. Unlike Datedif on Google Sheets, network days coincide with start\_date and end\_date as working days unless they are festive. Therefore, D7 Returns 1. Example 2. Networkdays.intl for Google sheets If you have a custom weekend schedule, you will benefit from another feature: Networkdays.intl. It allows you to count working days on Google Sheets based on the weekends personally established: =networks.intl (start\_date, end\_date, [Weekend], [vacations]) start\_date â€" a date used as a starting point. Requested. End Date: a date used as a final point. Requested. Note. Networkdays.intl on Google Sheets also counts START DAY and END DAY as days of work unless they are holidays. Weekend â€" This is optional. If omitted, Saturday and Sunday are considered. But you can alter that using two forms: masks. Propriate. In this way, it is perfect for when your free days are scattered throughout the week. The mask is a seven-digit pattern of 1 and 0. 1 means a weekend, 0 for a working day. TheDigit in the pattern is always on Monday, the last Sunday. For example, "1100110" means that the MIA @ rcols. Thursday, Friday and Saturday. Note. Masks must be placed in double quotes. Number. Use numbers of a Digo (1-7) that denote a pair of seven set Number of weeked 1 Sabbath, Sunday 2 Sunday, Monday 3 Monday, Tuesday 4 Tuesday, MIA @ Roles 5 MIA @ Roles, Thursday 6 Thursday, Friday 7 Friday, Saturday 8 Work with two-digit numbers (11-17) that they denote a day to rest within a week: Number of weeked 11 Sunday 12 Monday 13 Tuesday 14 MIA @ Roles 15 Thursday 16 Friday 17 Hollidays a 6-0 it is also optional and used for specify holidays. This function may seem complicated due to all these numbers, but I encourage you to try it, just have to clearly understand your free days. It's a Sunday and Monday, then decide the way to indicate their weekend. If you use a mask, it will be so as well: 2 In my case: =NetworkDays.intl (B2:C2, 2) then simply add the argument â€"Refer to the day in the E column, and the formula is ready: =networkdays.intl (B2, C2, 2, \$ E \$ 2: \$ E \$ 4) something more about days. If this is true for you and you prefer to get the difference in dates in months instead of days, let Google Sheets Datedif do the job. Example 1. Number of full months Between two dates The date is the same as the start date in first followed by the end date and the "m" â€" a € of "YM" Tip. Do not forget about the ROUFORMULA function that can help you count months in all rows at once: =arrayformula (datedif (A2: A13, B2: B13, "M")) Example 2. The number of months ignoring years It is possible that you do not need to count months along all the years between the start and end dates. And Datedif allows you to do that. Only use the "YM" unit and the formula will be subtracted entire years first, and then will count the number of months between dates: =datedif (A2, B2, "YM") the last (but not least) thing to show you is Google Sheets Datedif calculates the date difference in years. I will calculate the number of years couples couples It has been based on its wedding dates and today's date: as you may have guessed, I will use the unit "and" for that: =datedif (A2, B2, "Y") All these Datedif formulas are the first in Test when it comes to calculating days, months and years between two dates on Google Sheets. If your case can not be solved by these or if you have any questions, I encourage you to share them with us in the comments section below. You may also be interested in
